

1170. Compare Strings by Frequency of the Smallest Character

Solved

Medium Topics Hint

Let the function $f(s)$ be the **frequency of the lexicographically smallest character** in a non-empty string s . For example, if $s = "dccc"$ then $f(s) = 2$ because the lexicographically smallest character is 'c', which has a frequency of 2.

You are given an array of strings `words` and another array of query strings `queries`. For each query `queries[i]`, count the **number of words** in `words` such that $f(queries[i]) < f(W)$ for each W in `words`.

Return an integer array `answer`, where each `answer[i]` is the answer to the i^{th} query.

Example 1:

Input: `queries = ["cbd"], words = ["zaaaz"]`
Output: `[1]`
Explanation: On the first query we have $f("cbd") = 1$, $f("zaaaz") = 3$ so $f("cbd") < f("zaaaz")$.

Example 2:

Input: `queries = ["bbb", "cc"], words = ["a", "aa", "aaa", "aaaa"]`
Output: `[1, 2]`
Explanation: On the first query only $f("bbb") < f("aaaa")$. On the second query both $f("aaa")$ and $f("aaaa")$ are both $> f("cc")$.

Constraints:

- $1 \leq queries.length \leq 2000$
- $1 \leq words.length \leq 2000$
- $1 \leq queries[i].length, words[i].length \leq 10$
- `queries[i]`, `words[i]` consist of lowercase English letters.
